

## Research Statement

My personal growth plan always build upon that one never develop socially, intellectually, or academically, without consistently learning new things and striving to further oneself. This can include receiving regular input from students and consistently attempting to improve my teaching style, or trying new ideas or strategies on regular basis, keep pace with developments and cutting edge in Information technology. I do not see a rigid dividing line between research and teaching. Information technology is not a collection of facts, but rather, an area of research that is still alive with puzzles, contradictions, and new areas of inquiry. I try to encourage students to discover the excitement that can be found in researching the information technology world. Following these basic principles helped me grow in my love for teaching and learning. More importantly, I have discovered that teaching with clarity, passion, empathy, and sincere enthusiasm, effectively impacts learners, ultimately connecting them to their 'passion' and lifelong learning.
